

WHAT IS CLAIMED IS:

sub 3/ 1. A system for downloading firmware from a source module onto a controller of a storage medium with minimal latency of operation comprising:

5 (a) source means providing SCSI firmware for a disk drive and servo SCSI firmware for positioning said disk drive;

10 (b) a central processing unit having selection means for choosing single or dual two-dimensional array means for temporary storing said firmware prior to placement onto a target peripheral controller for said disk drive.

2. The system of claim 1 which includes:

(c) means for temporarily storing different versions of said firmware until said target controller has been accessed to identify the proper version of firmware required.

3. The system of claim 1 which includes:

(d) means for checking the pre-existing firmware in said target controller to determine whether an updated firmware version will be required for a subsequent download.

Sub B<sup>2</sup>7  
4.

A system for downloading SCSI firmware and SCSI servo firmware in a rapid fashion onto a target control module, said system comprising:

5 (a) a source means for said SCSI firmware and SCSI servo firmware;

10 (b) central processing means for receiving said firmware from said source means and utilizing a local memory means for separate storage areas for SCSI firmware and for SCSI servo firmware;

(c) connection means from said local memory means over to a selected one of a plurality of disk drives for temporary storage;

15 (d) peripheral controller means for loading said SCSI firmware into a first flash PROM and for loading said servo SCSI firmware into a second servo flash PROM;

20 (e) means to Write said firmware from said first flash and second flash PROMs onto a targeted peripheral controller for a disk unit.

5. The system of claim 4 wherein said source means includes control data received from the World Wide Web.

6. The system of claim 4 wherein said central processing means includes:

(b1) means for recognizing the number of bytes of firmware to be downloaded;

(b2) selecting a buffer array size which most closely approximates said recognized number of bytes to be downloaded.

7. The system of claim 4 wherein said central processing means includes:

(b3) inquiry means to said target controller to acquire identification information;

(b4) means to determine, from said identification information, what version of firmware will be downloaded to said target controller.

SUB AS7 8. A system for downloading the appropriate SCSI firmware onto a target module controller and overcoming the normal capacity limitations of temporary buffer storage comprising:

5 (a) source means for providing microcode firmware for a target controller;

10 (b) processor means having a first and second two-dimensional buffer array means for receiving and buffering said SCSI firmware and SCSI servo firmware destined for said target controller;

(c) means for transferring said SCSI firmware and servo firmware onto a targeted peripheral controller for a disk unit.

9. The system of claim 8 which includes:

(d) a library exported interface (USERMAINTREQUEST) for issuing a download command request and an inquiry command to query the target controller;

(e) means to access the appropriate firmware release numbers and servo release numbers to enable a selection of the appropriately proper firmware;

(f) selection means for selecting the appropriate size of said first and second two-dimensional buffer array means to most efficiently store said selected proper firmware.

10. The system of claim 9 wherein said inquiry command includes:

(g) means to check the pre-existing firmware in said target controller to determine whether new updated firmware is required.

11. The system of claim 8 which includes means for checking to indicate that the proper firmware has been downloaded to the proper target controller module.

SUB A7 12. A method of selecting and downloading the appropriate SCSI firmware and servo firmware for a selected target control module comprising the steps of:

5 (a) providing a plurality of separate storage media for holding different versions of SCSI firmware appropriate for different types of target control modules;

10 (b) utilizing a DFAST utility program for initiating a firmware download to a target control module;

(c) inquiring as to the identity and firmware requirements of a selected target control module;

15 (d) fetching, by a Central Processing Unit, of the appropriate firmware file from said storage media;

20 (e) selecting a single or double two-dimensional buffer array in relation to the byte count of said appropriate selected firmware for temporary storage;

(f) downloading the selected firmware onto said target control module.

13. The method of claim 12 wherein step (c) ~~includes the step of:~~

(c1) checking the ~~pre-existing~~ firmware in said target controller to determine whether or not it requires any updating from the selected firmware on the selected storage media.

5  
gle!

14. A system for rapid downloading, in one command cycle, of SCSI firmware and servo firmware into a target control module, comprising:

5 (a) means for initiating a SCSI Inquiry Command to said target control module via a Command Descriptor Block;

(b) means to query a designated target control module with information from a Page Code Field;

10 (c) means for enabling access to and acquiring a firmware page number and a firmware version number for said target control module;

(d) downloading said SCSI firmware data via selected sizes of two-dimensional buffer arrays;

15 (e) passing said SCSI firmware data onto said target control module.

15. The system of claim 14 which includes:

(f) means to sense when said ~~SCSI Inquiry~~  
Command initiates an illegal request.
